You must have:

Mathematical Formulae and Statistical Tables (Green), calculator

Total Marks

Candidates may use any calculator allowed by Pearson regulations.

Calculators must not have the facility for symbolic algebra manipulation, differentiation and integration, or have retrievable mathematical formulae stored in them.

Instructions

- Use **black** ink or ball-point pen.
- If pencil is used for diagrams/sketches/graphs it must be dark (HB or B).
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions and ensure that your answers to parts of questions are clearly labelled.
- Answer the questions in the spaces provided
 - *there may be more space than you need.*
- You should show sufficient working to make your methods clear. Answers without working may not gain full credit.
- Answers should be given to three significant figures unless otherwise stated.

Information

- A booklet 'Mathematical Formulae and Statistical Tables' is provided.
- There are 10 questions in this question paper. The total mark for this paper is 80.
- The marks for **each** question are shown in brackets
 - *use this as a guide as to how much time to spend on each question.*

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.

$$\mathbf{M} = \begin{pmatrix} 4 & -5 \\ 2 & -7 \end{pmatrix}$$

(a) Show that the matrix \mathbf{M} is non-singular.

(2)

The transformation T of the plane is represented by the matrix \mathbf{M} .The triangle R is transformed to the triangle S by the transformation T .Given that the area of S is 63 square units,(b) find the area of R .

(2)

(c) Show that the line $y = 2x$ is invariant under the transformation T .

(2)

$$\begin{aligned} a) \det \mathbf{M} &= 4(-7) - 2(-5) \\ &= -28 + 10 = -18 \\ &-18 \neq 0 \end{aligned}$$

$\therefore \mathbf{M}$ is non-singular.

$$b) \text{Area}_{\text{image}} = \text{Area}_{\text{object}} \times |\det \mathbf{M}|$$

$$63 = R \times |-18|$$

$$\therefore R = \frac{63}{18} = \boxed{\frac{7}{2}}$$

2. The cubic equation

$$2x^3 + 6x^2 - 3x + 12 = 0$$

has roots α , β and γ .

Without solving the equation, find the cubic equation whose roots are $(\alpha + 3)$, $(\beta + 3)$ and $(\gamma + 3)$, giving your answer in the form $pw^3 + qw^2 + rw + s = 0$, where p , q , r and s are integers to be found.

(5)

$$\omega = x + 3$$

$$\omega - 3 = x$$

$$\Rightarrow 2(\omega - 3)^3 + 6(\omega - 3)^2 - 3(\omega - 3) + 12 = 0$$

$$\Rightarrow 2(\omega^3 + 3(\omega^2)(-3) + 3(\omega)(-3)^2 - 27) + 6(\omega^2 - 6\omega + 9) - 3\omega + 9 + 12 = 0$$

$$\Rightarrow 2\omega^3 - 18\omega^2 + 54\omega - 54 + 6\omega^2 - 39\omega + 75 = 0$$

3. Prove by mathematical induction that, for $n \in \mathbb{N}$

$$\sum_{r=1}^n \frac{1}{(2r-1)(2r+1)} = \frac{n}{2n+1} \quad (6)$$

$$\underline{n=1} : LHS = \frac{1}{(2-1)(2+1)} = \frac{1}{3} //$$

$$RHS = \frac{1}{2+1} = \frac{1}{3} = RHS //$$

\therefore true for $n=1$.

$n=u$: assume true - ie

$$\sum_{r=1}^u \frac{1}{(2r-1)(2r+1)} = \frac{u}{2u+1}$$

consider $n=u+1$:

$$\begin{aligned} \Rightarrow \sum_{-1}^{u+1} \frac{1}{(2r-1)(2r+1)} &= \frac{u}{2u+1} + \frac{1}{(2u+1)(2u+3)} \\ &= \frac{u(2u+3) + 1}{(2u+1)(2u+3)} \end{aligned}$$

Question 3 continued

$$= \frac{2u^2 + 3u + 1}{(2u+1)(2u+3)}$$

$$= \frac{(2u+1)(u+1)}{(2u+1)(2u+3)}$$

$$= \frac{u+1}{2u+3}$$

$$= \frac{u+1}{2(u+1)+1} \quad \checkmark$$

\therefore true for $n = u+1$.

So statement is:

- true for $n=1$
- true for $n=u+1$
when assumed
true for $n=u$

\therefore By Mathematical Induction
it's true for all $n \in \mathbb{Z}^+$.

4. The line l has equation

$$\frac{x+2}{1} = \frac{y-5}{-1} = \frac{z-4}{-3}$$

The plane Π has equation

$$\mathbf{r} \cdot (\mathbf{i} - 2\mathbf{j} + \mathbf{k}) = -7$$

Determine whether the line l intersects Π at a single point, or lies in Π , or is parallel to Π without intersecting it.

(5)

$$l: \mathbf{r} = \begin{pmatrix} -2 \\ 5 \\ 4 \end{pmatrix} + \lambda \begin{pmatrix} 1 \\ -1 \\ -3 \end{pmatrix}$$

$$\begin{pmatrix} 1 \\ -1 \\ -3 \end{pmatrix} \cdot \begin{pmatrix} 1 \\ -1 \\ -3 \end{pmatrix} = 1 + 2 - 3 = 0.$$

So the normal to Π is
also normal to l .

$\therefore l$ either lies on Π or

is parallel w/o intersecting.

To check if l lies in Π ,
we can substitute $\begin{pmatrix} -2 \\ 5 \\ 4 \end{pmatrix}$ into
 Π and check that

LHS = RHS :

Question 4 continued

$$r \cdot \begin{pmatrix} -1 \\ -1 \\ -3 \end{pmatrix} = -7$$

$$\begin{pmatrix} -2 \\ 5 \\ 4 \end{pmatrix} \cdot \begin{pmatrix} -1 \\ -1 \\ -3 \end{pmatrix} = -2 - 5 - 12 = -19 \neq -7$$

$\therefore L$ does not lie on π .

So L must be parallel to π w/o intersecting

- (a) Explain why z_1 , z_2 and z_3 cannot all be roots of a quartic polynomial equation with real coefficients. (2)

(b) Show that $\arg\left(\frac{z_2 - z_1}{z_3 - z_1}\right) = \frac{\pi}{4}$ (3)

(c) Hence show that $\arctan(2) - \arctan\left(\frac{1}{3}\right) = \frac{\pi}{4}$ (2)

A copy of Figure 1, labelled Diagram 1, is given on page 12.

- (d) Shade, on Diagram 1, the set of points of the complex plane that satisfy the inequality

$$|z+2| \leq |z-1-i| \quad (2)$$

a) since $-1+2i$ and $1+i$ are roots, then $-1-2i$ and $1-i$ must also be roots, giving us a total of 5 roots. But Quartic polynomials have 4 roots.

$$\therefore \frac{z_2 - z_1}{z_3 - z_1} = \frac{1 + 2i}{3 + i} = \frac{(1+2i)(3-i)}{(3+i)(3-i)}$$

$$= \frac{3 + 5i + 2}{10} = \frac{1}{2} + \frac{1}{2}i$$

$$\arg\left(\frac{1}{2} + \frac{1}{2}i\right) = \arctan(1)$$

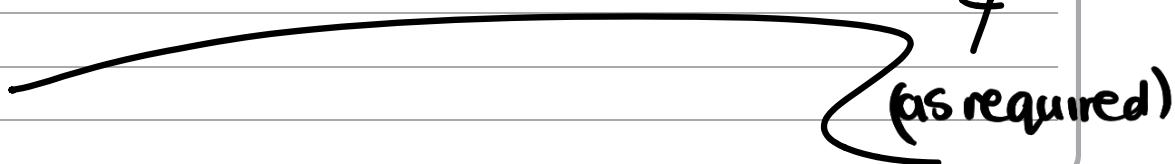

$$= \boxed{\frac{\pi}{4}}$$

8. A gas company maintains a straight pipeline that passes under a mountain.

The pipeline is modelled as a straight line and one side of the mountain is modelled as a plane.

There are accessways from a control centre to two access points on the pipeline.

Modelling the control centre as the origin O , the two access points on the pipeline have coordinates $P(-300, 400, -150)$ and $Q(300, 300, -50)$, where the units are metres.

- (a) Find a vector equation for the line PQ , giving your answer in the form $\mathbf{r} = \mathbf{a} + \lambda\mathbf{b}$, where λ is a scalar parameter.

(2)

The equation of the plane modelling the side of the mountain is $2x + 3y - 5z = 300$

The company wants to create a new accessway from this side of the mountain to the pipeline.

The accessway will consist of a tunnel of shortest possible length between the pipeline and the point $M(100, k, 100)$ on this side of the mountain, where k is a constant.

- (b) Using the model, find

- (i) the coordinates of the point at which this tunnel will meet the pipeline,
- (ii) the length of this tunnel.

(7)

It is only practical to construct the new accessway if it will be significantly shorter than both of the existing accessways, OP and OQ .

- (c) Determine whether the company should build the new accessway.

(2)

- (d) Suggest one limitation of the model.

(1)

$$\text{a) } \overrightarrow{PQ} = \overrightarrow{OQ} - \overrightarrow{OP} = \begin{bmatrix} 300 \\ 300 \\ -50 \end{bmatrix} - \begin{bmatrix} -300 \\ 400 \\ -150 \end{bmatrix}$$

$$= \begin{bmatrix} 600 \\ -100 \\ 100 \end{bmatrix}$$

so: $\mathbf{r} = \begin{pmatrix} -300 \\ 400 \\ -150 \end{pmatrix} + \lambda \begin{pmatrix} 600 \\ -100 \\ 100 \end{pmatrix}$ is one equation.

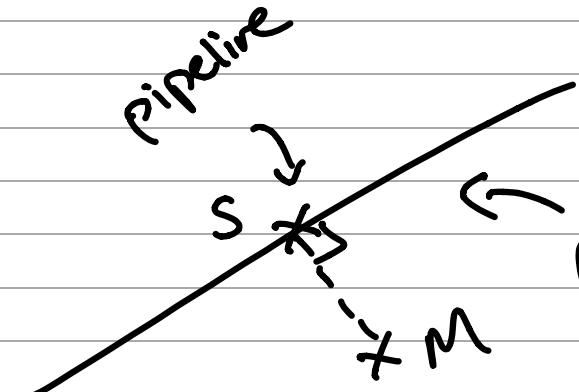

Question 8 continued

b) i) plane: $r \cdot \begin{pmatrix} 2 \\ 3 \\ -5 \end{pmatrix} = 300$

M lies on the plane:

$$\begin{pmatrix} 100 \\ k \\ 100 \end{pmatrix} \cdot \begin{pmatrix} 2 \\ 3 \\ -5 \end{pmatrix} = 300$$

$$200 + 3k - 500 = 300$$

$$3k = 600$$

$$k = 200.$$

[where S is the closest point to M on the Pipeline]

$$\overrightarrow{SM} = \begin{pmatrix} 600\lambda - 300 \\ 400 - 100\lambda \\ 100\lambda - 150 \end{pmatrix} - \begin{pmatrix} 100 \\ 200 \\ 100 \end{pmatrix} = \begin{pmatrix} 600\lambda - 400 \\ 200 - 100\lambda \\ -250 + 100\lambda \end{pmatrix}$$

\overrightarrow{SM} is perpendicular to pipeline:

$$\begin{pmatrix} 600\lambda - 400 \\ 200 - 100\lambda \\ -250 + 100\lambda \end{pmatrix} \cdot \begin{pmatrix} 600 \\ -100 \\ 100 \end{pmatrix} = 0$$

$$\Rightarrow 360000\lambda - 240000 - 20000 + 10000\lambda - 25000 + 10000\lambda = 0$$

$$\Rightarrow 380000\lambda = 285000 \therefore \lambda = 3/4_{11}$$

Question 8 continued

$$\therefore \overrightarrow{OS} = \begin{pmatrix} 600\left(\frac{3}{4}\right) - 300 \\ 400 - 100\left(\frac{3}{4}\right) \\ 100\left(\frac{3}{4}\right) - 150 \end{pmatrix} = \begin{pmatrix} 150 \\ 325 \\ -75 \end{pmatrix}$$

(ii) length = $|\overrightarrow{SM}|$

- 10.** The population of chimpanzees in a particular country consists of juveniles and adults. Juvenile chimpanzees do not reproduce.

In a study, the numbers of juvenile and adult chimpanzees were estimated at the start of each year. A model for the population satisfies the matrix system

$$\begin{pmatrix} J_{n+1} \\ A_{n+1} \end{pmatrix} = \begin{pmatrix} a & 0.15 \\ 0.08 & 0.82 \end{pmatrix} \begin{pmatrix} J_n \\ A_n \end{pmatrix} \quad n = 0, 1, 2, \dots$$

where a is a constant, and J_n and A_n are the respective numbers of juvenile and adult chimpanzees n years after the start of the study.

$$9472a = \frac{28416}{5}$$

$$a = \frac{28416}{5} = \boxed{\frac{3}{15}}$$

iii) from (ii), $J_n = \frac{6144}{0.82\left(\frac{3}{5}\right) - \frac{3}{250}}$

$$= 12800$$

Question 10 continued

$$\therefore \text{change} = 15360 - 12800 \\ = \boxed{2560}$$

c) Not very suitable as our model tells us the Juvenile population is increasing (in the short term).

d) We must introduce a third column for chimpanzees above 40.

ie

$$\begin{bmatrix} J_{n+1} \\ A_{n+1} \\ K_{n+1} \end{bmatrix} = \begin{bmatrix} a_1 & a_2 & 0 \\ 0.08 & a_3 & 0 \\ 0 & a_4 & a_5 \end{bmatrix} \begin{bmatrix} J_n \\ A_n \\ K_n \end{bmatrix}$$
